

App Store & Google Play Compliance Audit

Date: August 9, 2026 | **Status:** AUDIT PASSED & MANIFESTS GENERATED | **Author:** Strategic Technical Architecture Desk

Executive Overview

To safeguard the **IHS Initiative** mobile ecosystem against store rejection vectors (Apple App Store Guideline 4.3 Spam/WebView flags, missing iOS Privacy Manifests, Google Data Safety mismatches, and memory leaks), this pre-flight compliance package has been generated and validated.

1. Apple iOS Required Reason Privacy Manifest (`PrivacyInfo.xcprivacy`)

Starting Spring 2024, Apple strictly enforces `PrivacyInfo.xcprivacy` for all submitted iOS binaries. Undeclared API access results in immediate automated reject code ITMS-91053.

Accessed API Category	Approved Reason Code	Monorepo Usage Justification
UserDefaults	CA92.1	Persisting offline auth session tokens and user preference toggles within app sandbox.
File Timestamp	C617.1	Calculating local cache validity for Encrypted Health Vault medical documents.
System Boot Time	35F9.1	Monotonic clock measurement for emergency ALS dispatch sub-300s SLA timer calculation.

Declared Privacy Data Types

- **Precise Location:** Linked to user identity; strictly for emergency ambulance dispatch (never tracked for ads).
- **Health & Medical Data:** Linked to user identity; strictly for EHR chart records, e-Rx generation, and vault storage.
- **Contact Info (Name & Phone):** Linked to user identity; for patient profile identification and SMS triage alerts.

2. Apple Guideline 4.3 (Spam / Web View Wrapper) Mitigation

Apple flags AI-generated apps that simply wrap a web URL inside a WKWebView. To guarantee approval, the IHS mobile application incorporates **3 Hardware-Native Hooks**:

Native Mechanism	Implementation Component	Store Review Approval Impact
Background Geolocation	CoreLocation Background Mode	Continuous streaming GPS during active P1 ambulance emergency dispatch.
Biometric Vault Unlock	LocalAuthentication (FaceID / TouchID)	Hardware enclave authentication for AES-256 Health Vault decryption.
Push Tele-Triage Alerts	UserNotifications (APNs / FCM)	Low-latency emergency dispatch push notifications directly to lock screen.

3. Google Play Data Safety & India DPDP Act 2023 Compliance

For Google Play Store submission and compliance with India's **Digital Personal Data Protection (DPDP) Act 2023**, the data handling specification is configured as follows:

- **Data Encryption in Transit:** Mandatory TLS 1.3 / HTTPS for all endpoint routes (`/api/billing/checkout`, `/api/vault`).
- **Data Encryption at Rest:** AES-256-GCM encryption on database medical records and vault storage buffers.
- **Right to Erasure (DPDP Sec. 12):** Built-in self-serve account and data deletion handler at /settings/privacy/delete-account.
- **Third-Party Sharing:** Zero external data sharing or ad network tracking (`shared\_with\_third\_parties: false`).

4. Memory Leak & OOM Guardrails Checklist

Automated store review bots run apps through stress-testing virtual machines. To prevent Out-Of-Memory (OOM) crashes:

```
// 1. React Leaflet/Map Canvas Cleanup Guardrail
useEffect(() => {
  const mapInstance = L.map('telemetry-hud');
  return () => {
    mapInstance.off();
    mapInstance.remove(); // Prevents webgl context retention leaks
  };
}, []);

// 2. WebSocket Telemetry Stream Disconnect Guardrail
useEffect(() => {
  const ws = new WebSocket(DISPATCH_WS_URL);
  return () => {
    if (ws.readyState === WebSocket.OPEN) ws.close(1000, "Component Unmounted");
  };
}, []);
```
